General Theory of Analysis and Test

Dr. Paul West

Department of Computer Science
College of Charleston

January 16, 2014
General engineering principles:
- Partition: divide and conquer
- Visibility: making information accessible
- Feedback: tuning the development process

Specific A&T principles:
- Sensitivity: better to fail every time than sometimes
- Redundancy: making intentions explicit
- Restriction: making the problem easier
Sensitivity: Better to Fail Always Than Sometimes

- Consistency helps:
  - A test selection criterion works better if every selected test provides the same result, i.e., if the program fails with one of the selected tests, it fails with all of them (reliable criteria)
  - Run time deadlock analysis works better if it is machine independent, i.e., if the program deadlocks when analyzed on one machine, it deadlocks on every machine

- Race conditions

- Array Bound’s checking in Java vs C/C++
#include <assert.h>

char before[] = "Before=";
char middle[] = "Middle";
char after[] = "After";

int main(int argc, char *argv[]){
    strcpy(middle, "Muddled"); /*Fault, but may not fail*/
    strncpy(middle, "Muddled", sizeof(middle)); /*Fault, but may not fail*/
    stringCopy(middle, "Muddled", sizeof(middle)); /*Guaranteed to fail*/
}

void stringCopy(char *target, const char *source, int len){
    assert(strlen(source) < len);
    strcpy(target, source);
}
Redundancy

- Defensive programming / Defense in Depth
- Redundant checks can increase the capabilities of catching specific faults early or more efficiently.
  - Static type checking is redundant with respect to dynamic type checking, but it can reveal many type mismatches earlier and more efficiently.
  - Validation of requirement specifications is redundant with respect to validation of the final software, but can reveal errors earlier and more efficiently.
  - Testing and proof of properties are redundant, but are often used together to increase confidence.
Simplifying the problem by adding a rule (restriction).

**Example**

```java
static void questionable(){
    int k, i;

    for(i = 0; i < 10; ++i){
        if(someCondition(i)){
        }
        else{
            k += i;
        }
    }
}
```

How does C/C++ handle this? Java?
Restriction: Simplify the Problem

- Suitable restrictions can reduce hard (unsolvable) problems to simpler (solvable) problems.
  - A weaker spec may be easier to check: it is impossible (in general) to show that pointers are used correctly, but the simple Java requirement that pointers are initialized before use is simple to enforce.
  - A stronger spec may be easier to check: it is impossible (in general) to show that type errors do not occur at run-time in a dynamically typed language, but statically typed languages impose stronger restrictions that are easily checkable.
Partition: Divide and Conquer

- Process level Partition: Unit test, Integration Test, System Test, etc...
- Hard testing and verification problems can be handled by suitably partitioning the input space:
  - Both structural and functional test selection criteria identify suitable partitions of code or specifications (partitions drive the sampling of the input space)
Visibility: Judging Status

- The ability to measure progress or status against goals
  - $X$ visibility = ability to judge how we are doing on $X$, e.g., schedule visibility = “Are we ahead or behind schedule,” quality visibility = “Does quality meet our objectives?”
- Involves setting goals that can be assessed at each stage of development
  - The biggest challenge is early assessment, e.g., assessing specifications and design with respect to product quality
- Related to observability
  - Example: Choosing a simple or standard internal data format to facilitate unit testing (text over binary)
Feedback: Tuning the Development Process

- Learning from experience: Each project provides information to improve the next

- Examples
  - Checklists are built on the basis of errors revealed in the past
  - Error taxonomies can help in building better test selection criteria
  - Design guidelines can avoid common pitfalls
Summary

The discipline of test and analysis is characterized by 6 main principles:

- Sensitivity: better to fail every time than sometimes
- Redundancy: making intentions explicit
- Restriction: making the problem easier
- Partition: divide and conquer
- Visibility: making information accessible
- Feedback: tuning the development process

They can be used to understand advantages and limits of different approaches and compare different techniques.
Chapter 1 Assignment

Choose and complete any two Chapter 3 Exercises (pg 38)
Always explain your answers.
